Business Intelligence and Analytics

Develop Innovative, Data-driven Strategies

Your Trainer: Cristiane Mancini

Academic Background

- Holding both bachelor's and master's degrees in Economics from the Pontifical Catholic University of São Paulo, Brazil, has enabled Cristiane to produce analyses and reports on international trade, macroeconomic trends, consumer behaviour, energy, mobility, agribusiness, metals and mining, among other sectors, supporting more accurate and informed decision-making

Management and Mentoring

- Managing and mentoring diverse teams across Europe, Asia and the United States. She has worked with more than 100 global clients, including government institutions and multinational companies, developing a strategic ability to understand, access and build markets

The “Data Product” Mindset – Data as a Product

Value Mapping Framework

A Value Map connects everyday operational activities and product features directly to high-level strategic goals and customer outcomes.

The Value Map bridges the gap between what a company develops/does and what stakeholders truly value and expect.

Depending on the context (product management, sales, post-sales, or lean operations), a standard Value Mapping Framework typically breaks down into key structural layers.

Fundamentals and Data Culture

Business Analytics vs Business Intelligence

- **Information management** is the lifecycle process of collecting, storing, organizing, securing, and distributing information across an organization to ensure it remains accurate, accessible, and compliant.
- The Lifecycle Information **Creation & Acquisition**: Capturing raw inputs from internal software/platforms, documents, user interactions/surveys, or digital transaction records.
- **Organization & Classification**: Labeling and structuring the files using metadata, taxonomy systems, and standardized folders so everything stays easy to search.
- **Secure Storage**: Archiving the materials in cloud infrastructure, local servers, or relational databases with strict access permissions to block cyber threats.
- **Distribution & Usability**: Building simple distribution pipelines, permissions, and tools so team members can seamlessly pull up documents for daily work.
- **Retention & Disposition**: Systematically purging outdated records or safely archiving documents according to industry compliance and regulatory laws.

Data Visualization

Data Visualization tools

- Designed to transform raw, structured datasets into interactive charts, graphs, maps, and dashboards.
- As established in the data analysis lifecycle, visualization is the bridge between technical data, insights and business strategy.
- It translates complex statistical models, outlier detection patterns, and industry indicators into clear, universal visual stories that anyone can understand at a glance.

- When rolling out your strategic data roadmap, avoid selecting a tool purely based on brand popularity.
- If your team consists of business generalists who love Excel, start with Power BI to lower the barrier to entry.
- If you have dedicated data engineers, analysts or other teams need to run heavy multi-source diagnostic metrics, invest in the enterprise's capabilities.
- AI tools may seem convenient but need to be used with utmost care and attention.
